

Avira Phantom VPN Pro

Surf the Internet
securely and anonymously – anywhere

Privacy protection

Avira Phantom VPN Pro masks your IP address. Nobody can determine your location, track your Internet activities, or see where and when you're surfing. There are also no logs that reveal to unauthorized people which websites you're visiting.

WiFi and public hotspot security

With Avira Phantom VPN Pro, your data doesn't leave your computer, tablet, or smartphone unencrypted – even when you're on the move and using public WiFi hotspots. Data remains in a secure transmission tunnel and is encrypted using state-of-the-art 256-bit technology.

Surfing the Internet is part of everyday life. We visit websites, shop, bank, email, stream, game, and chat online. However, our online actions can easily be tracked and spied on by organizations. It's even more dangerous when criminals spy on confidential data like credit card information such as when surfing using public WiFi hotspots. And that's not all: Your IP address always reveals your precise location.

Bypass geoblocking

By masking your IP address, you can bypass geographical restrictions and access videos, news, sports shows, and series which you would otherwise be unable to enjoy.

Avira Phantom VPN Pro puts an end to this unwanted transparency: Every item of data users transmit over unsecured networks is encrypted, your IP address is masked, and geo-location restrictions are removed.

Excellent software – Made in Germany and recommended by security experts.
